Problem Statement 3: Campus Placement & Internship Pipeline

Lab 2: Agile Backlog Creation and Sprint Simulation in Jira

1. EPICS and Burndown Chart

Epics Created

- **Epic 1:** Student Application & Profile Management
- **Epic 2:** Interview Logistics & Placement Management
- **Epic 3:** Offer Management

Jira Workspace Screenshots

1. Jira backlog with Epics, User Stories, and Story points

2. Active Sprint board for Sprint 1

3. Burndown Chart for Sprint 1

4. Burndown Chart for Sprint 2

Reflection Questions

1. Did your estimations reflect the actual effort?

Yes. Using that Fibonacci sequence made it easier to scale things. For example, giving the resume parsing algorithm an 8 felt pretty accurate since doing that in real life would be harder than just coding a single-click apply button, which I only gave a 3.

2. Was your backlog well-prioritized?

I believe it was. I made sure to put the core features that students actually need to apply (like uploading the resume and hitting the apply button) as High priority. Those got pulled into Sprint 1 first. The other stuff, like the Placement Officer sending out email notifications, was set to Medium so it could wait.

3. How did your simulated sprint align with your plan?

Since it was just a simulation where I was clicking and moving the tickets myself, it aligned perfectly. There were no unexpected bugs or scope creep, so everything smoothly went from "To Do" to "In Progress" and finally to "Done."

4. What insights did the burndown chart give about your team's capacity?

Looking at the chart, the red line just drops straight down at the very end instead of sloping down nicely like the grey guideline. In a real project, this would mean our team just logged all our work as "Done" at the exact same time right before the sprint ended, rather than finishing things gradually throughout the week.
